

HOCKEY

Time does not stand still. Hockey players make increasingly more demands on a field. That is why Happy Feet is continuously searching for the ideal solution for each level of hockey play. This has resulted in our sand dressed practice fields.

STATE OF ART

A relatively inexpensive solution that makes it possible for every team to play on an artificial field. Moreover, the water field was developed for the first-class hockey segment. Besides the choice of what type of artificial grass, there is also responsibility for the financial management. Based on our knowledge of foundations, we have succeeded in devising several forms of construction that make no concessions to the playing characteristics and quality of the artificial turf.

• Sand-filled fields

Most fields have a sand-filled artificial turf. A high-quality grass on a foundation in which special shock-absorbing materials ensure good playing characteristics. A pile length of 23mm is well above the standard and guarantees maximum durability. It is constructed on a sport-related layer that is free of patents. This means that when replacing the turf in 10 to 15 years time, renewal is not hindered by claims from other companies: the owner should then also be free to choose.

• Semi-water fields

Play top-class hockey on polyethylene artificial grass. The dense, shorter and slightly curled fibres, in combination with a thinly-dispersed layer of sand, creates a fast and very level field. Polyethylene has ideal playing characteristics for the hockey player and, due to the optional sprinkler system, a field is created that approaches a water field. As an extra benefit, the construction costs are considerably lower than those of a water field, due to the sophisticated "soft" foundation.

• Water fields

An Olympic Champion on a water field. Perfect playing characteristics due to a foundation that is provided with a so-called e-layer. It is a very dense artificial turf made from high-quality slightly curled polyethylene fibres, which are also UV resistant. Sprinkling with water affects the behaviour of the ball positively and play is possible in all conditions. Experience hockey on a fast and level field. That is possible not only for top players but also for amateurs. Happy Feet advises clubs and schools on their choice of the best construction and the appropriate operating costs. To keep our advice in tune with developments in sports floors, we utilise the experience of top hockey players. A constructive method allowing the players to determine their ideal sports floor.

State of the art: HF hockey

Happy Feet hockey fields meets the demands of the hockey player and the standards of the FIH easily.
